Introduction - Programming

Programming: Everyday Decision-Making Algorithms

Dr. Tobias Vlćek

Kühne Logistics University Hamburg - Winter 2025

About this Course

Teaching Team

Dr. Tobias Vlćek

Dr. Nils Roemer

About me

- **Field:** Optimizing and simulating complex systems
- **Languages:** of choice: Julia, Python and Rust
- **Interest:** Modelling, Simulations, Machine Learning
- **Teaching:** OR, Algorithms, and Programming
- **Contact:** vlcek@beyondsimulations.com

We really appreciate active participation and interaction!

Agenda

- About the course, team, and expectations
- How to learn programming (mindset and resources)
- Setting up Python with uv and VS Code
- Using notebooks with uv
- Q&A and next steps

Course Outline

- I: Optimal Stopping
- II: Explore & Exploit
- III: Caching
- IV: Scheduling
- V: Randomness
- VI: Computational Kindness

Participation

- Try **actively participating** in this course
- You will find it much **(!)** easier and more fun
- Lecture based on the book **Algorithms to live by**[1]
- Material and slides are hosted online: beyondsimulations.github.io/Programming-Everyday-Decisions

Teaching

- **Lecture:** Presentation and discussion of algorithms related to everyday decision-making
- **Tutorial:** Step-by-step assignments to be solved and discussed together in groups
- **Difficulty:** Strongly depends on your background and programming experience

No worries, we will help you out if you have any questions!

Passing the Course

- Pass/fail course without exams
- **75% attendance** required for passing the course
- Hand in the assignments of at least two lectures
- Short presentation and discussion at the end
- You work together in groups of three students

Handing in Assignments

- Each student group submits **one solution**
- Provide us **all** working notebooks of the lecture
- Hand in is due at the **beginning of the next lecture**
- At least **50 %** have to be correct to pass
- **You have to pass at least twice**

This is just in order to provide you with working solutions after each deadline.

Learning Python

We will mostly **not cover Python during the lectures!**

Question: Anybody know why?

- In our experience, the best way to learn is by **doing**!
- Here, we will focus on decision-making algorithms
- You will learn Python by **doing the tutorials**

Don’t worry, we will help you out if you have any questions!

Difficulty of the Course

- At first it might be **a little bit overwhelming**
- Programming is similar to learning a **new language**
- First, you have to **get used to it** and learn words
- **Later**, you'll be able to apply it and see results
- Important: *Practice, practice, practice!*

Goals of the Course

- Learn the **basics of programming**
- Learn about **algorithmic thinking**
- Be able to **apply** methods and concepts
- **Solve practical problems** with algorithms

We are convinced that this course will be quite interesting and **teach you more for your daily life** than most other courses!

Why Python?

- **Origins**: Conceived in late 1980s as a teaching and scripting language
- **Simple Syntax**: Python's syntax is mostly straightforward and very easy to learn
- **Versatility**: Used in web development, data analysis, artificial intelligence, and more
- **Community Support**: A large community of users worldwide and extensive documentation

Help from AI

- You are **allowed to use AI** in the course, we use it as well (e.g., Claude, ChatGPT, LLama3 ...)
- These **tools are great** for learning Python!
- Can help you a lot **to get started** with programming

> ⚠ But you should *not* simply use them to *replace* your learning.

Learning to program

Our Recommendation

1. **Be present**: Attend the lecture and solve the tutorials
2. **Put in some work**: Repeat code and try to understand it
3. **Do coding**: Run code, play around, modify, and solve

Great resources to start are books and small challenges. You can find a list of book recommendations at the end of the lecture. Small challenges to solve can for example be found on Codewars.

Don’t give up!

- Programming is **problem solving**, don’t get **frustrated**!
- Expect to **stretch** your comfort zone

Setting up Python

Install VS Code

- Download and install from the website
- Built for Windows, Linux and Mac
- Install the Python and Jupyter extension
- **Now you are ready to go!**

Unsure on how to work with VS Code and notebooks? Ask us! We are happy to help you out!

What is an IDE?

- Integrated Development Environment = application
- It allows you to write, run and debug code scripts
- Other IDEs include for example:
  - PyCharm from JetBrains
  - Zed

Installation of Python with `uv`

- We will use `uv` to install and manage Python versions
- It works on Windows, Mac and Linux
- It helps us to manage packages and virtual environments
- Now, we all go here and install `uv` and Python

If the installation does not work, **let us know!**

Notebooks with uv

Quick Check

- Have you installed `uv` and initialized the project?
- Great! Before we continue, check the following:
  - [] You have a folder for the course
  - [] You have initialized `uv` with `uv init` inside the folder
  - [] You can see a file called `pyproject.toml` in the folder

Something not working yet? Ask us!

Using Notebooks

- Now we need to add a kernel to our project
- Run `uv add --dev ipykernel` from your terminal
- Now run `uv add jupyter` in the terminal
- This allows us to use `uv` Python in notebooks
- Done? Perfect. Now we can start!

Working with Notebooks

- Now you can download the files from the website
- Just click on one of the sessions and open it
- Select `Jupyter` on the right side
- Download and save the files **to your course folder**
- Open them and select “Open with Jupyter Notebook”

That was the hardest part today!

Any questions so far?

After the break — Optimal Stopping

- The “Secretary Problem” and the 37% rule
- When to stop searching and make a decision
- How to translate the idea into code and experiments

> **That’s it for our introduction!**
> Let’s have a short break and then continue with our first topic.

Literature

Interesting literature to start

- Christian, B., & Griffiths, T. (2016). Algorithms to live by: the computer science of human decisions. First international edition. New York, Henry Holt and Company.[1]
- Ferguson, T.S. (1989) ‘Who solved the secretary problem?’, Statistical Science, 4(3). doi:10.1214/ss/1177012493.

Books on Programming

- Downey, A. B. (2024). Think Python: How to think like a computer scientist (Third edition). O'Reilly. Here
- Elter, S. (2021). Schrödinger programmiert Python: Das etwas andere Fachbuch (1. Auflage). Rheinwerk Verlag.

Think Python is a great book to start with. It's available online for free. Schrödinger Programmiert Python is a great alternative for German students, as it is a very playful introduction to programming with lots of examples.

More Literature

For more interesting literature, take a look at the literature list of this course.
