Lecture V - Randomness

Programming: Everyday Decision-Making Algorithms

Dr. Tobias Vlćek

Kühne Logistics University Hamburg - Winter 2024

Welcome!

Today's Topic: Randomness

Topic: Understanding how randomness powers algorithms and decision-making in computer science and everyday life

Why this matters: Randomness isn't just about gambling. It's a powerful tool that makes computers faster, cryptography secure, and helps us solve problems. Today we'll learn how embracing uncertainty can lead to better solutions.

Today's Agenda

1. **Understanding Randomness** - From casinos to algorithms
2. **Randomness in Daily Life** - Where we encounter it without realizing
3. **Computer Science Applications** - Monte Carlo, simulated annealing, cryptography
4. **Decision Making** - Using randomness to solve hard problems

Randomness

Randomness

Question: What comes to your mind when you think of randomness?

Casino

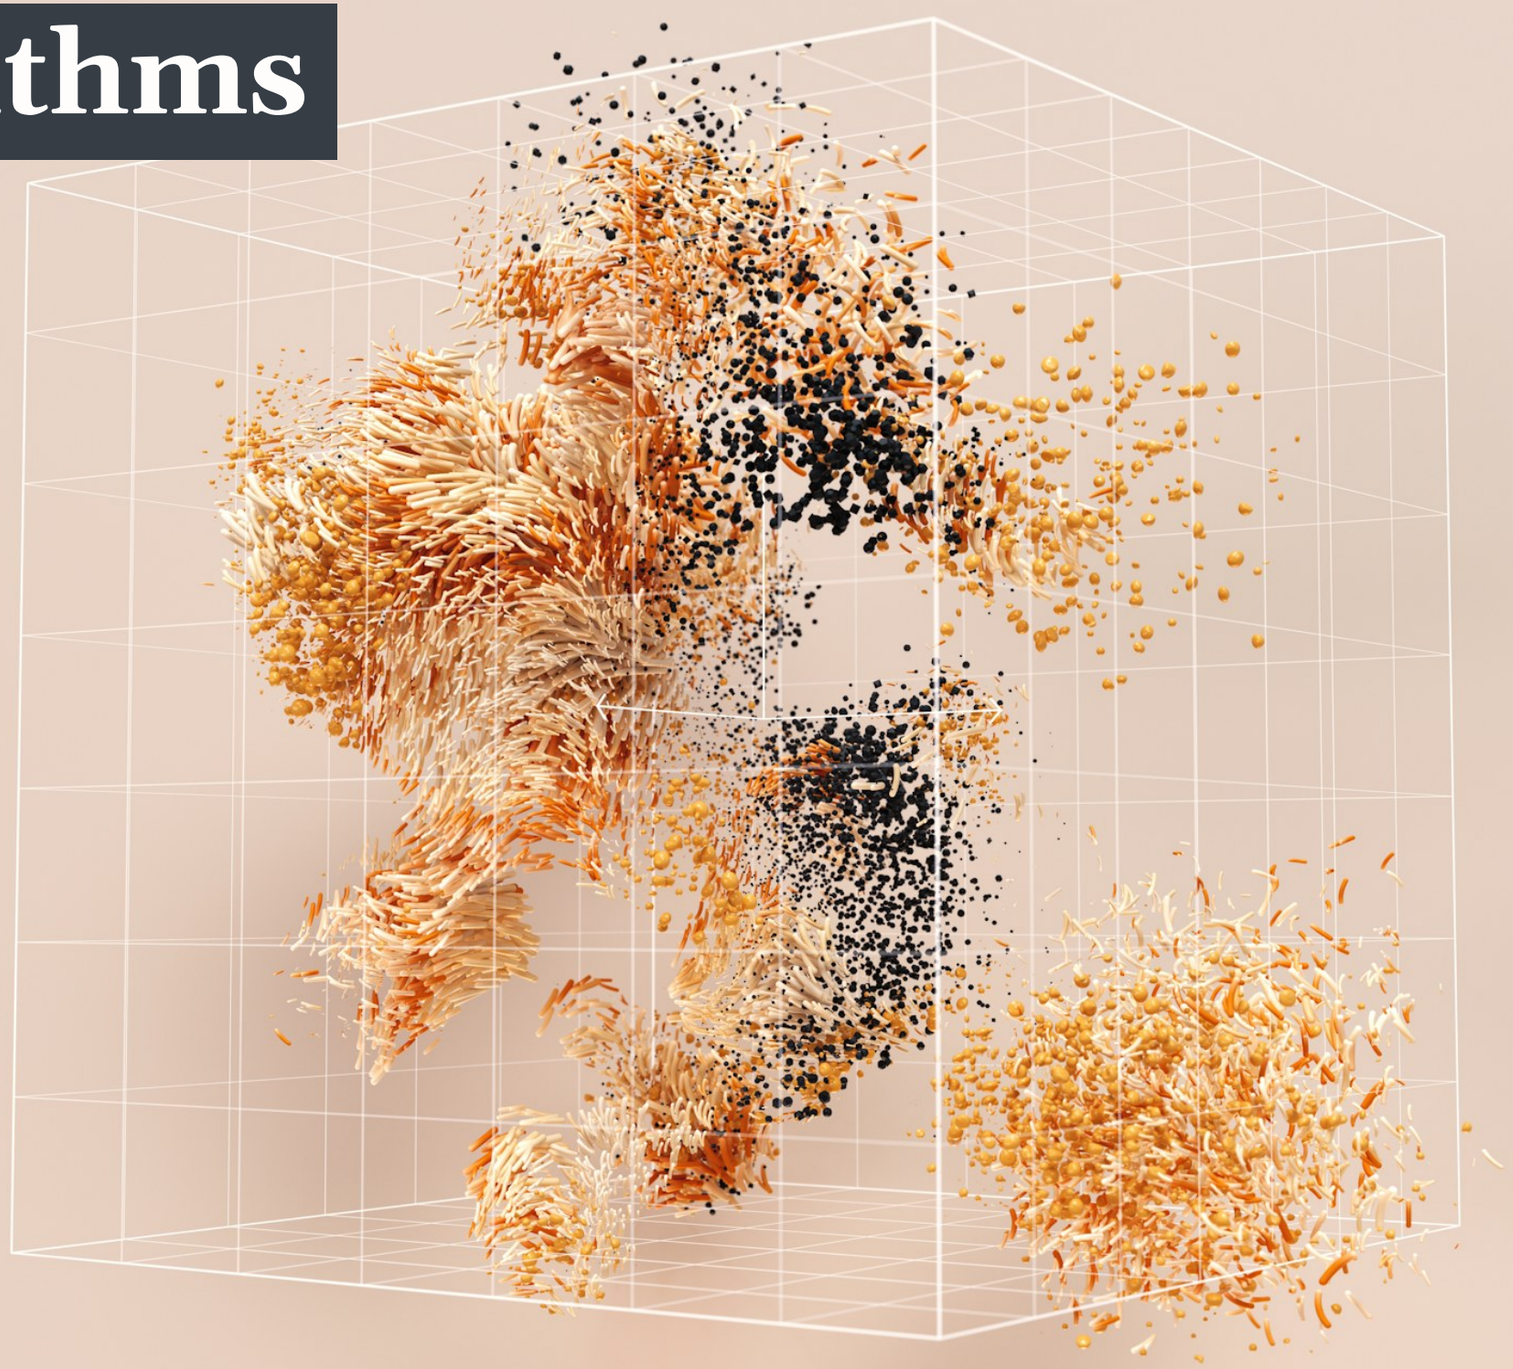

Lottery

LOTTO
Schleswig-Holstein

Hier 5 aus 50 Zahlen ankreuzen
Hier 2 aus 10 Eurozahlen ankreuzen
Los-Nr. für Spiel 77, GlücksSpirale und Sieger-Chance/Spielscheinnummer
Los-Nr. für SUPER 6
Los-Nr. für Spiel 77 u
Spielscheir
FREITAG IST

Shuffling cards

Algorithms

Cryptography

Genetic mutations

Why Randomness Matters

Question: What's the opposite of randomness?

- Determinism - same input, same output
- Predictability - knowing the outcome in advance
- Consistency - reliable patterns

- **Boredom?**

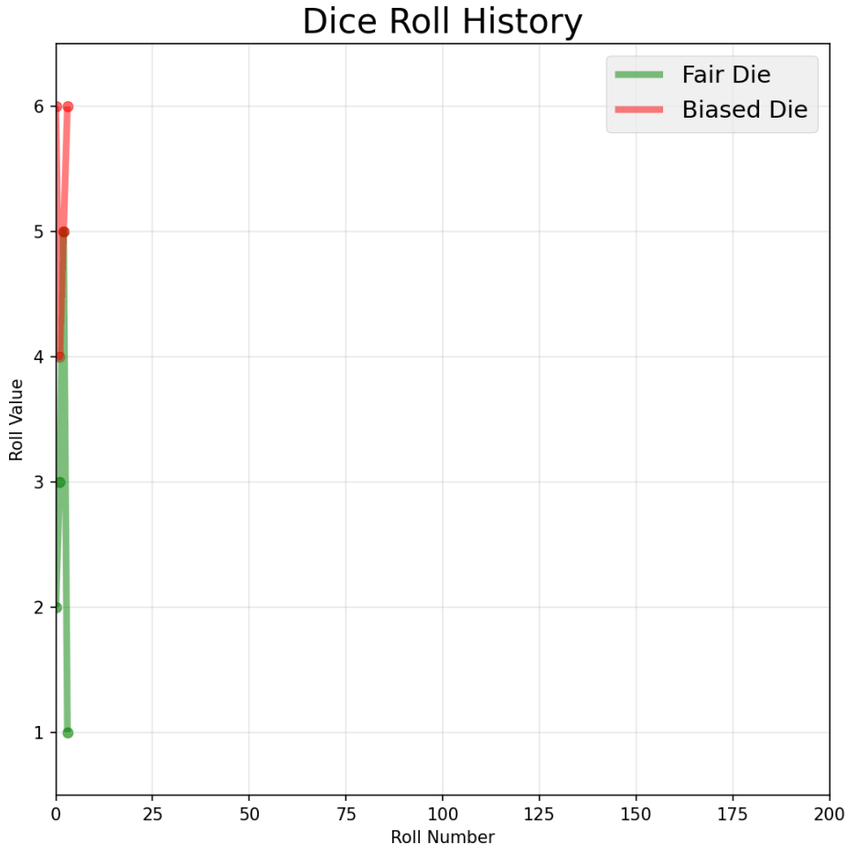

Discovery by Randomness

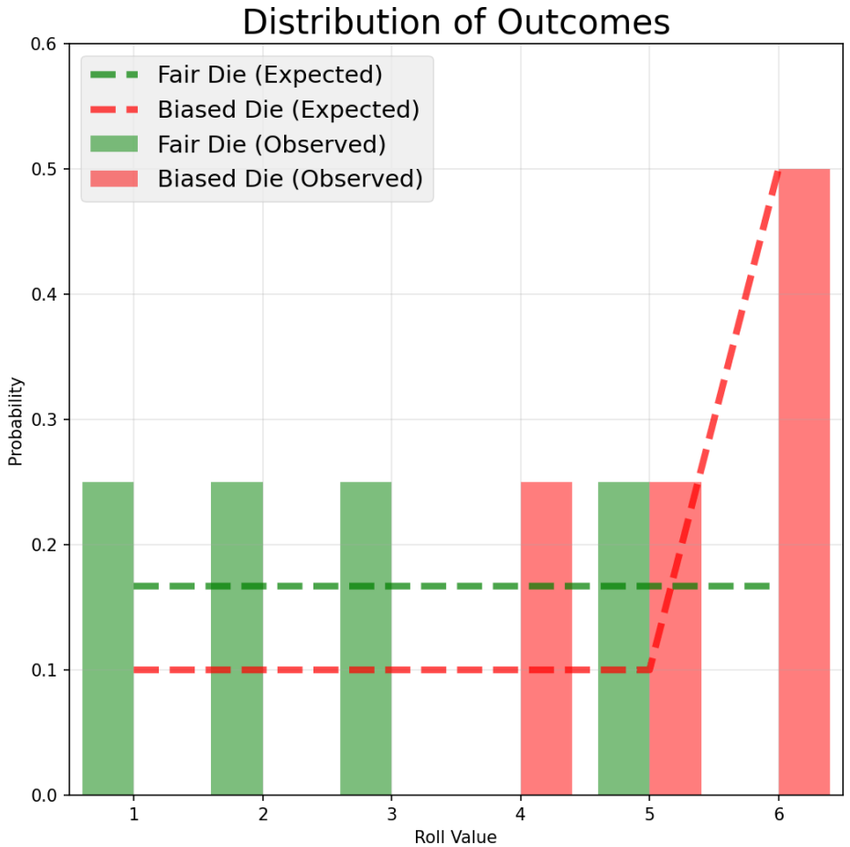

Question: How would you test if a pair of dice is fair?

- Send the dice to a lab to **check weight and balance**

- Roll the dice many times
- Check if the outcomes are uniformly distributed
- Compare observed frequencies to expected frequencies

Dice Rolls

Using Randomness

Randomness is a **fundamental aspect of the world**

- **Testing:** Generate random inputs to find bugs
- **Optimization:** Escape local optima in complex problems
- **Simulation:** Model complex systems with uncertainty
- **Security:** Make systems unpredictable to attackers
- **Fairness:** Eliminate bias in selection processes

> ⚠ Randomness is not just about **generating random numbers**!

Daily Life

Randomness and Everyday Life

Question: Where do you encounter randomness in daily life?

Social Life

- **Dating apps:** Randomized matching within preferences
- **Random encounters** that lead to friendships
- **Career opportunities** from unexpected connections
- **Breaking ties** through coin tosses
- **Netflix recommendations:** Controlled randomness for discovery

Entertainment Industry

- **Pokémon:** “Random” encounters weighted by rarity
- **Loot systems:** Rare items have controlled drop rates
- **Chess AI:** Introduces randomness to feel more human-like
- **Spotify shuffle:** Deliberately less random to feel natural
- **TikTok:** Controlled randomization for content discovery

Cryptography & Security

- **Cryptocurrency mining:** Solving cryptographic puzzles through guessing
- **Password generators:** Balance randomness and memorability
- `correct-horse-battery-staple` is more secure than `Tr0ub4dor&3`
- **Modern encryption** relies on random number generation
- **Two-factor authentication** uses random codes

Data Science & Research

- **Weather forecasting:** Uses randomness to model uncertainty
- **Stock algorithms:** Add randomness to avoid predictable patterns
- **Self-driving cars:** Random elements for natural-feeling behavior
- **Random sampling:** Ensures unbiased research results
- **A/B testing:** Random assignment to treatment groups

Randomness is **everywhere** around us!

Computer Science

Randomness in Algorithms

Why do computer scientists love randomness?

- **Efficiency:** Often faster than deterministic approaches
- **Simplicity:** Can solve complex problems with simple code
- **Robustness:** Avoids worst-case scenarios
- **Approximation:** “Good enough” solutions in reasonable time

> **Key Trade-off:** Perfect vs. “Good Enough” solutions

Types of Randomness

Question: Difference between true and pseudo-randomness?

True Randomness

- Physical phenomena
- Atmospheric noise
- Radioactive decay
- Quantum effects

Pseudo-randomness

- Deterministic algorithms
- Seed-based generation
- Repeatable sequences
- Good enough for most uses

Limits of Computation

Question: How many possible combinations exist in a shuffled deck of cards?

```python
import math
print(math.factorial(52))
```

```
80658175170943878571660636856403766975289505440883277824000000000000
```

> ⚠ Computing and evaluating all possible combinations is not feasible!

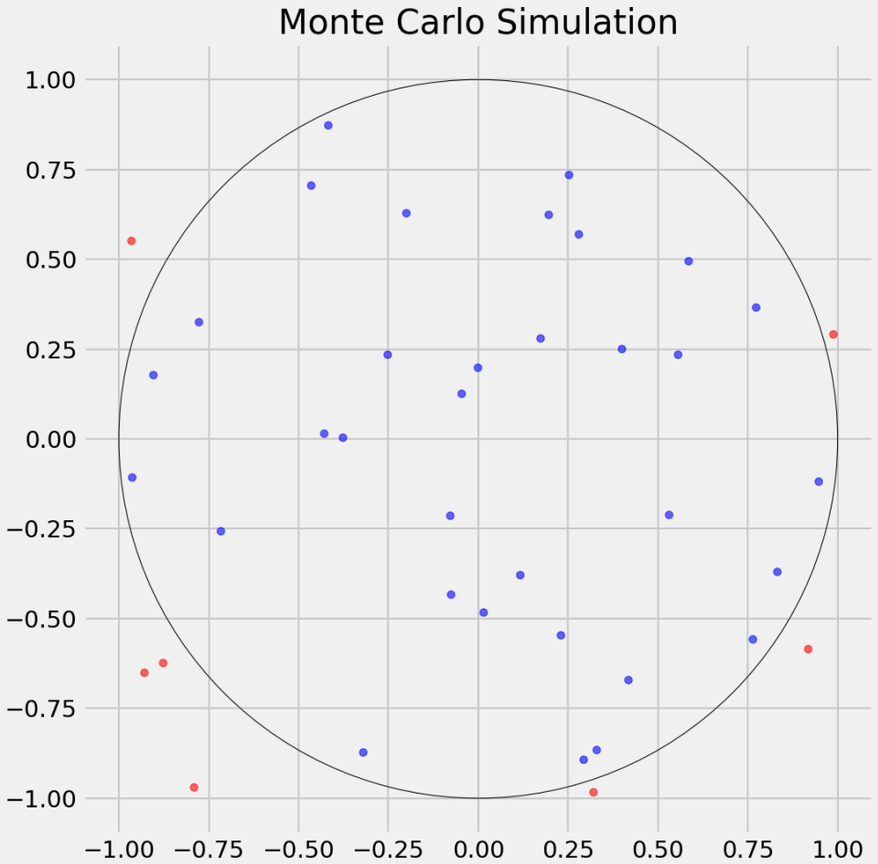

Computational Limits

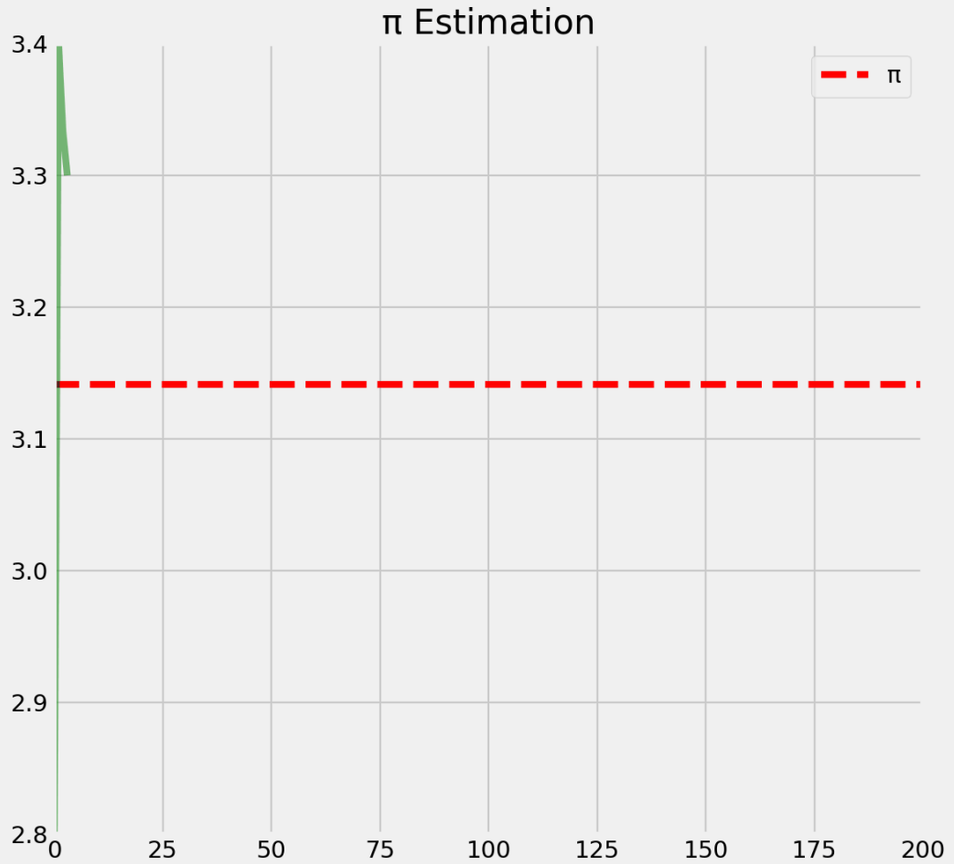

Question: Anybody ever heard of “Monte Carlo methods”?

- Developed in the 1940s for nuclear weapons research
- Nuclear fission chain reactions were too complex
- Helped to **evaluate the probabilities of different outcomes**
- Named after Monaco’s famous casino

Question: How could we estimate π?

Estimating π

Decision Making

Travel Itinerary

Question: How and in which order would you visit 10 cities by plane with minimal total distance?

```
1 import math
2 print(math.factorial(10))
```

```
3628800
```

Question: What could be a strategy?

Brute Force

- Try **every possibility**
- Total possible routes: 10! = 3,628,800
- Guaranteed to find best solution
- If each check takes 1ms: 1 hour to check all routes

Question: What could be the problem with this approach?

Time and Space Requirements

- For 20 cities: 20! = **2.4 quintillion** routes
- Would take **77 billion years** at 1ms per check!
- **Time complexity** grows **factorially**
- **Memory requirements** increase with problem size

> ⚠ **Not feasible for real-world problems!**

Greedy Algorithm

- Example: Always picking shortest next flight
- Make locally optimal choices at each step
- **Never backtracks or reconsiders past decisions**
- Fast execution & simple to implement
- Can perform poorly on complex problems

Hill Climbing

- **Iteratively improve solution** by making small changes
- Like climbing in fog, can only see immediate surroundings
- Don’t know if higher peaks exist elsewhere
- Can get stuck in local optima
- No guarantee of finding global best optima

Question: How would you escape a local optimum?

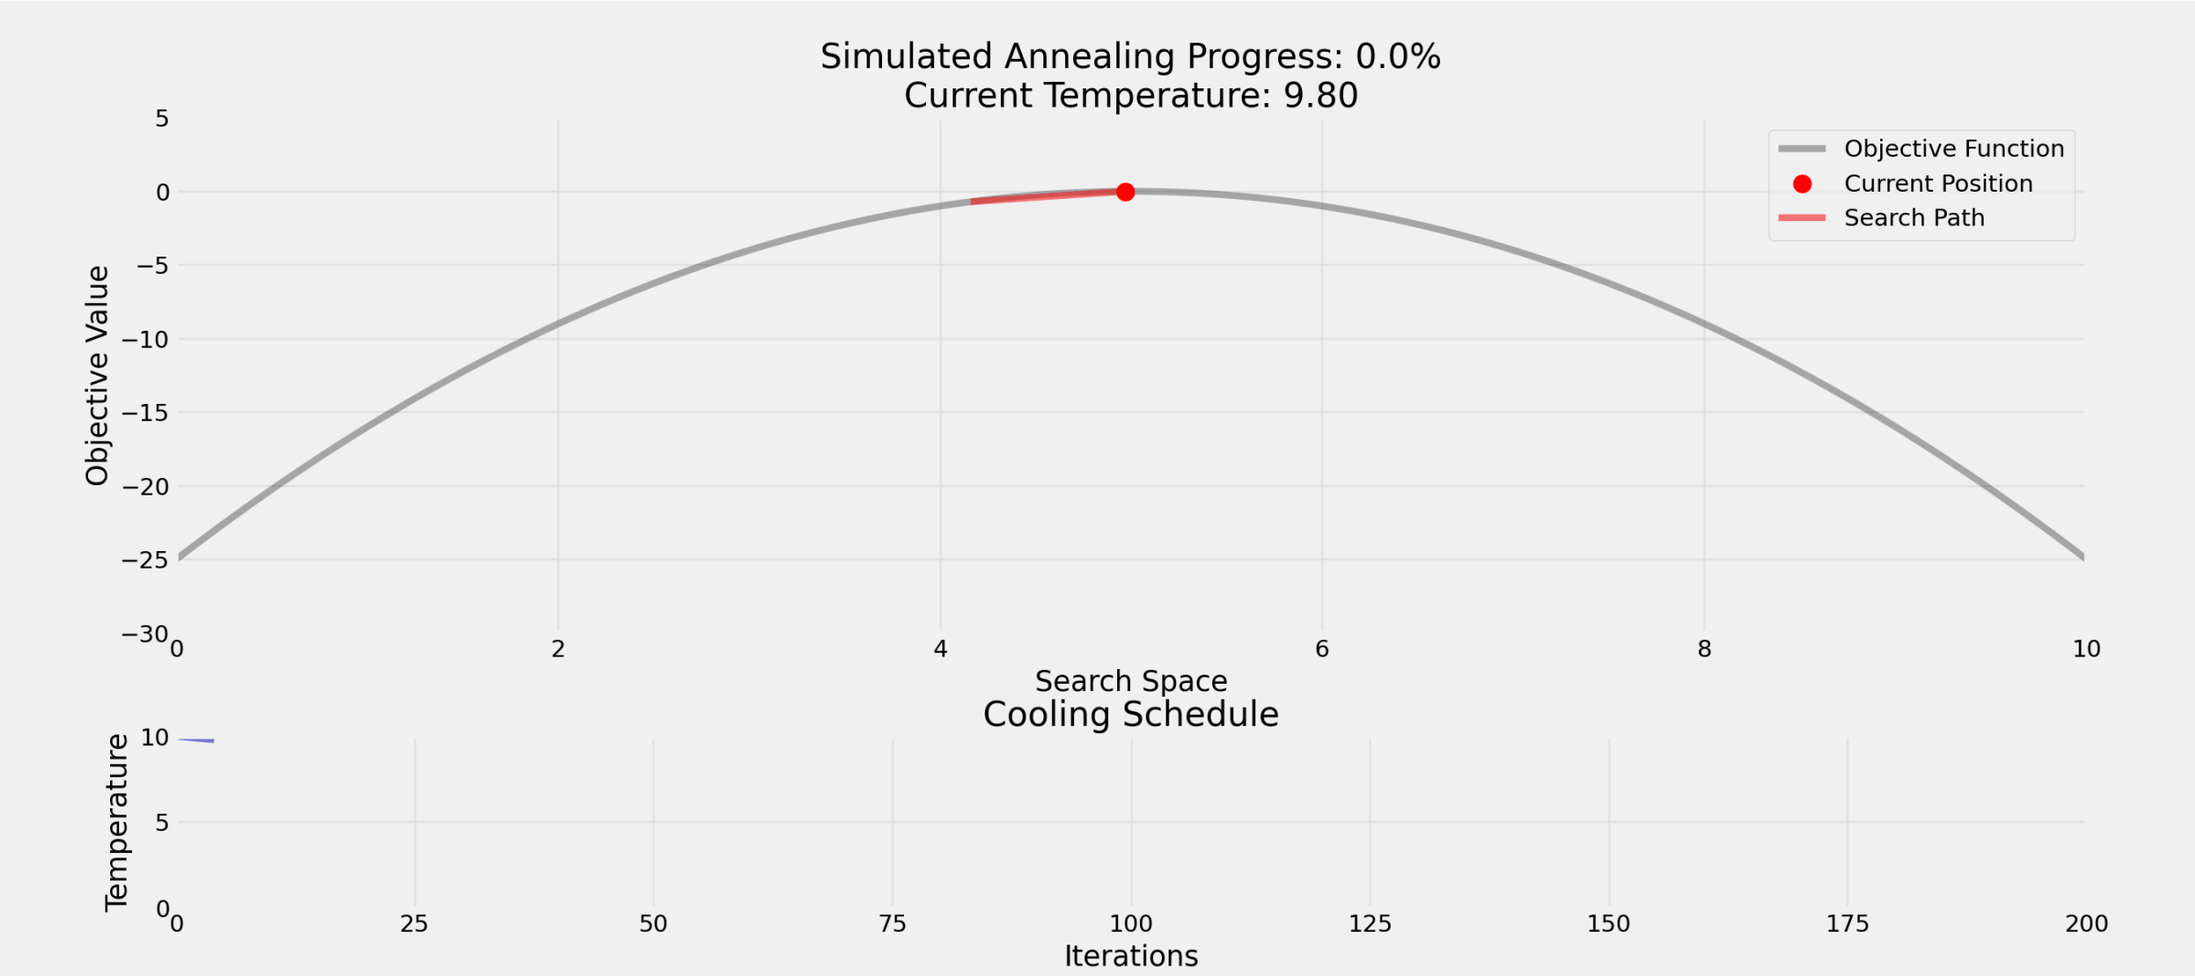

Simulated Annealing (SA)

- Make random changes and accept improvements
- Sometimes accept worse solutions
- Gradually become more selective

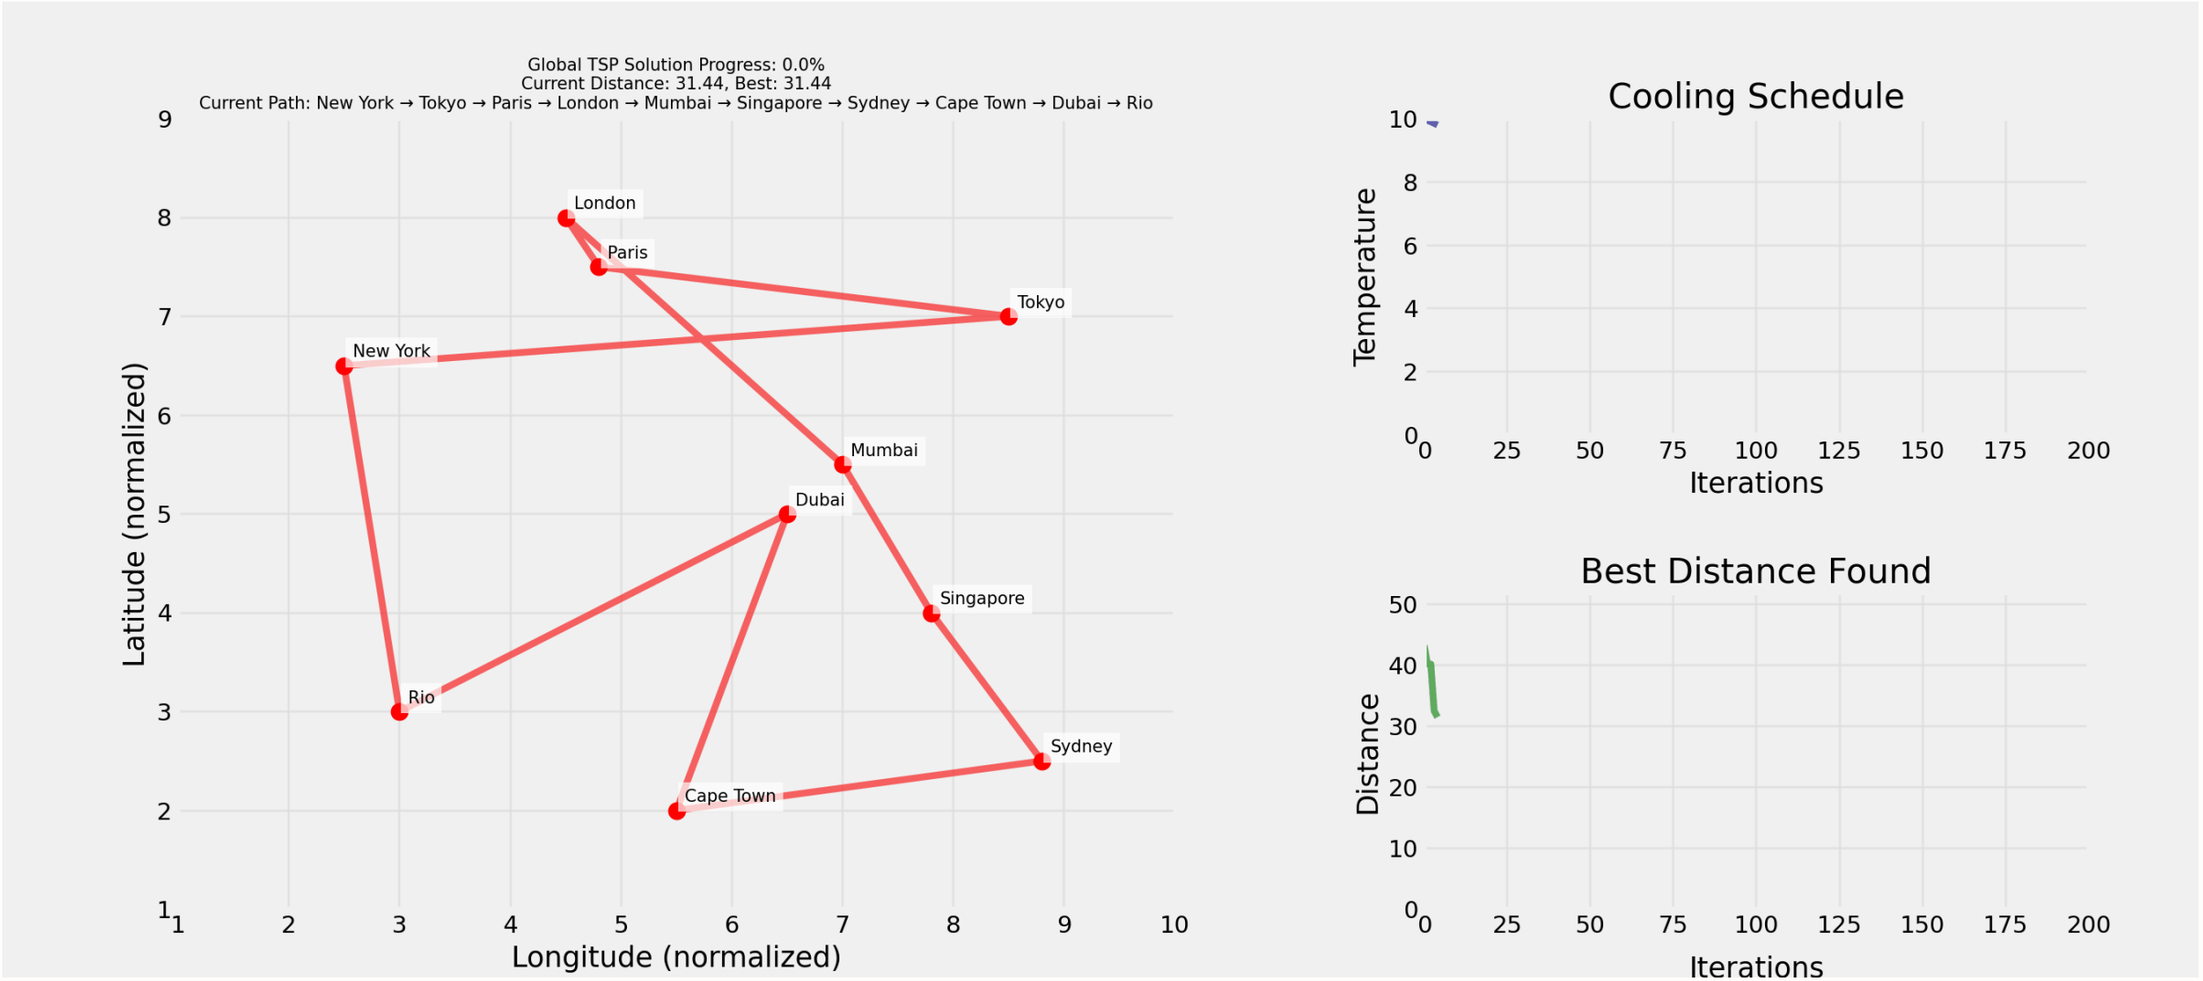

Question: Why accept worse solutions sometimes?

- Randomness helps to escape local optima
- Balances **exploration vs. exploitation**

SA Animation

Traveling Salesman

Society

Thought Experiment

What's more important for a society?

Freedom

- Individual choice
- Personal responsibility
- Market-driven

Equality

- Shared resources
- Social safety nets
- Regulated systems

Question: Any problem with this question?

Veil of Ignorance

You might **randomly** be:

- Any gender identity and economic status
- Any health condition and intelligence level
- Any cultural background and religious belief

Question: If you didn't know who you'd be born as, what kind of society would you design?

Key Considerations

- **Individual stories:** Powerful but potentially misleading
- **Statistics:** Comprehensive but can miss nuance
- **Hidden diversity:** Important subgroups may be overlooked
- **Small policy changes can have cascading effects**

> ⚠ But that's not all! We also need to measure **success** and **failure**!

Measuring Success

- **Mean happiness:** Average well-being
- **Total happiness:** Utilitarian approach
- **Median happiness:** Focus on the middle class
- **Minimum happiness:** Protecting the most vulnerable

Question: What could be the problem with these measures?

Idea: Random Sampling

- Randomly **select a subset of the population**
- Gather diverse perspectives from the sample
- Better understand needs of population
- Reduce selection bias and improve accuracy

Question: What is a selection bias?

Selection Bias

Definition: Selection bias occurs when the sample data you're analyzing **isn't truly representative of the population** you're trying to study.

⚠ **Famous Example**

During WWII, engineers studied returning planes to determine where to add armor. Initially, they focused on areas with most bullet holes. Abraham Wald pointed out they should instead armor the areas with *no* bullet holes - those were the critical areas where planes didn't survive to return!

Promoting Fairness

Question: How can randomness promote fairness?

- Random allocation of patients in clinical trials
- Random audits for tax compliance
- Random assignment of cases to judges
- Random order of candidates on voting ballots

Uncertainty

Quick Poll

Question: Which would you prefer?

- 100% chance of winning 50 EUR
- 50% chance of winning 120 EUR

Answer depends on your risk aversion!

Decisions Under Uncertainty

Question: When should we embrace vs. reduce randomness?

Embrace When:

- Exploring new solutions
- Avoiding bias
- Breaking deadlocks
- Testing systems

Reduce When:

- Safety-critical systems
- Financial transactions
- Medical procedures
- Legal proceedings

Takeaways

“Good Enough” Solutions

- Perfect is enemy of good
  - Remember Monte Carlo methods: approximations work
  - Complete analysis often impossible
  - **Perfect information is rare**

Many real-world problems benefit from embracing uncertainty rather than fighting it!

Opportunity Costs

- **Consider opportunity costs**
  - Quick approximations enable faster decisions
  - Balance accuracy vs. computation time
  - Random sampling vs. complete enumeration

Many problems benefit from **fast, good-enough solutions** rather than perfect ones.

Any questions so far?

After the break — Randomness

- Programming session in our new notebooks
- How to translate the idea into code and experiments
- Different scheduling algorithms applied to problems

> **That's it for today's lecture!**
> We've covered the basics of randomness and its applications. In the upcoming tutorials, we'll learn how to use LLMs to generate code with randomness.

Literature

Interesting literature to start

- Christian, B., & Griffiths, T. (2016). Algorithms to live by: the computer science of human decisions. First international edition. New York, Henry Holt and Company.[1]

Books on Programming

- Downey, A. B. (2024). Think Python: How to think like a computer scientist (Third edition). O'Reilly. Here
- Elter, S. (2021). Schrödinger programmiert Python: Das etwas andere Fachbuch (1. Auflage). Rheinwerk Verlag.

Think Python is a great book to start with. It's available online for free. Schrödinger Programmiert Python is a great alternative for German students, as it is a very playful introduction to programming with lots of examples.

More Literature

For more interesting literature, take a look at the literature list of this course.
